Mental Imagery: A (Partial) Resolution to the Debate; and an Introduction to Judgment
Summing Up the Experiments

• Certain types of operations may be performed on mental images:
  – Rotation (Shepard/Metzler)
  – Scanning (Kosslyn, Ball, and Reiser)
• Visual/Spatial cognition interferes with mental imagery
  – Brooks “moving-star” experiment
• Mental imagery seems to recreate some effects...
  – Ponzo illusion
  – McCollough effect
  – Resolution (Finke experiment)
• But not others
  – Ambiguous figures
  – Finding “parts” of figures
Arguments against “pictorial” model of mental imagery

- Introspection is an insufficient guide
- “Hidden” knowledge (e.g., direction to scan)
- Background knowledge (Pylyshyn’s “cognitive impenetrability”)
- The “parsimony” argument
- Mental imagery seems to do too much
- Mental imagery doesn’t do enough (Hinton’s example)
Figure 6.10 The division of the pattern activation subsystem into two more specialized subsystems, one that encodes categories (perhaps represented as prototypes) and one that encodes specific exemplars. The subsystems are illustrated in the context of the subsystems discussed previously.
Things that Kosslyn’s model is intended to account for

- Imagery is *effortful* (because “top-down” connections to visual cortex are weaker and fade quickly)
- Imagery is accompanied by *semantics* and *perceptual organization*
- Differential effects of imagery in (e.g.) color, shape, motion
- Clinical evidence (e.g., hemispheric inattention)
Fig. 1. Schematic of the structure of a trial in the imagery and perception conditions. In the imagery condition, participants kept their eyes closed throughout the scan. Each trial began with the name of a previously studied object, presented auditorily via headphones. In the imagery condition, participants had to generate a visual mental image of the object. In the perception condition, participants saw a faint picture of the named object. In both cases, participants had to wait for the auditory probe (4.5 s later, “W”, meaning “wider than tall” in this schematic) specifying the judgment to be performed. Upon hearing the probe, participants performed the judgment as quickly and accurately as they could, and response times (RT) and accuracy were recorded.
Where the research is...

- Relationship between 2D and 3D imagery
- Relationship between imagery and other sensory input (especially tactile)
- Role of mental imagery in “larger” representations (e.g., prototypes, scripts)
- Static vs. dynamic imagery
- Imagery in scientific and mathematical thought and creativity
The Cliff Problem

The Spiral Tube Problem
Impetus Theory in the Field, According to Walther H Ryff (1582)
Lunar Phases:

1. New Moon
2. Waning Crescent
3. First Quarter
4. Waning Gibbous
5. Full Moon
6. Waning Gibbous
7. Last Quarter
8. Waxing Crescent

The Seasons on Earth:

- Autumnal Equinox: The first day of Autumn in the Northern Hemisphere
- Summer Solstice: The first day of Summer in the Northern Hemisphere
- Summer: The first day of Summer in the Northern Hemisphere
- Vernal Equinox: The first day of Spring in the Northern Hemisphere
- Spring: The first day of Spring in the Northern Hemisphere
- Winter Solstice: The first day of Winter in the Northern Hemisphere
- Winter: The first day of Winter in the Northern Hemisphere

The Sun and the Earth are not to scale in this drawing.
**Modus Ponens**

If there is fire, there is smoke.

There is fire.

∴ There is smoke.

**Modus Tollens**

If there is fire, there is smoke.

There is not smoke.

∴ There is not fire.
Logical Fallacies

Denial of the Antecedent

If there is fire, there is smoke.

There is not fire.

\[ \therefore \text{ There is not smoke.} \]

Affirmation of the Consequent

If there is fire, there is smoke.

There is smoke.

\[ \therefore \text{ There is fire.} \]
Wason's Selection Task

If a card has a vowel on one side, then it has an even number on the other side.

E  K  4  7

If a card has a vowel on one side, then it has an even number on the other side.
"Permission Schema"

If a person is drinking beer, then the person must be over 19 years of age.

- Typicality Effects (and the "gambler's fallacy")
Imagine that the United States is preparing for the outbreak of an unusual Asian disease that is expected to kill 600 people. Two alternative programs to combat the disease have been proposed. Assume that the exact scientific estimates of the consequences of the program are as follows:

If Program A is adopted, 200 people will be saved. If Program B is adopted, there is a one-third probability that 600 people will be saved and a two-thirds probability that no people will be saved.

Which of the two programs would you prefer?
Imagine that the United States is preparing for the outbreak of an unusual Asian disease that is expected to kill 600 people. Two alternative programs to combat the disease have been proposed. Assume that the exact scientific estimates of the consequences of the program are as follows:

If Program C is adopted, 400 people will certainly die.

If Program D is adopted, there is a one-third probability that no one will die and a two-thirds probability that 600 people will die.

Which of the two programs would you prefer?
First, we are offered a bonus of $300. Then, we are asked to choose between the two following possibilities:

A. To receive $100 for sure; or

B. To toss a coin. If we win the toss, we will get $200; if we lose, we receive nothing at all.
First, we are offered a bonus of $500. Then, we are asked to choose between the two following possibilities:

C. We are guaranteed to lose $100.

D. We toss a coin, and if we lose, we have to pay $200, but if we win, we don't have to pay anything.
The Conjunction Effect

Bill is 34 years old. He is intelligent, but unimaginative, compulsive, and generally lifeless. In school, he was strong in mathematics but weak in social studies and humanities.
Bill is a doctor, and his hobby is playing poker.

Bill is an architect.

Bill is an accountant.

Bill plays jazz for a hobby.

Bill surfs for a hobby.

Bill is a reporter.

Bill is an accountant who plays jazz for a hobby.

Bill climbs mountains for a hobby.
Steve is very shy and withdrawn, invariably helpful, but with little interest in people or in the world of reality. A meek and tidy soul, he has a need for order and structure, and a passion for detail.

A clinical test, designed to diagnose a specific illness, comes out positive for a certain patient.

We are told that:

1. The test is 90 percent reliable. That is, if we give the test to 100 people who have the disease, 90 percent of the tests will come out positive; if we give the test to 100 people who do not have the disease, 90 percent will come out negative.

2. On average, this illness affects 1 percent of the population in the same age group as the patient.

What is the probability that this patient actually has the illness?
\[ P(\text{sick}|\text{pos}) = \frac{P(\text{pos}|\text{sick}) \times P(\text{sick})}{P(\text{pos})} \]

\[ = \frac{0.9 \times 0.01}{(0.9 \times 0.01) + (0.1 \times 0.99)} \]

\[ = 0.083 \]
A certain town is served by two hospitals. In the larger hospital about 45 babies are born each day, and in the smaller hospital about 15 babies are born each day. As you know, about 50 percent of all babies are boys. The exact percentage of baby boys, however, varies from day to day. Sometimes it may be higher than 50 percent, sometimes lower.

For a period of one year, each hospital recorded the days on which (more/less) than 60 percent of the babies born were boys. Which hospital do you think recorded more such days?
Typicality Effects

Which sequence of coin tosses is more likely?

H H H H H H H H

H T T H T H T H

Memory Effects

Estimate the proportion of English words that begin with the letter "K" versus words that have a "K" in the third position.
The Let's Make A Deal Problem

- Behind one door is a great prize. (The usual "great prize" on the old Let's Make a Deal show was a car.)

- The other two doors conceal a "Zonk" prize. (The usual "Zonk prize" on the old show was a goat or some other farm animal.)

- You get to choose one door.

- Once you have chosen, Monty Hall will open a "Zonk" door among the remaining two doors, and will ask "Do you want to change your choice to another door?"

**Should you change your choice?**

Example: You choose Door No. 1. Monty opens up Door 2 (revealing the inevitable goat) and asks if you want to switch to Door No. 3.
Let's Make A Deal (The Manic Version)

- You choose a door among these 24.
- Monty throws open 22 Zonk doors and asks "Do you want to switch?"
Suppose we have to choose between pairs drawn from a list of 100. Further suppose:

a. When both objects are recognized, we have a 60 percent chance of getting the right answer. (E.g., is Munich a bigger city than Berlin?)

b. When both objects are unrecognized, we have a 50 percent chance. (Essentially, we’re just “flipping a coin”: is Dortmund bigger than Duisberg?)

c. When one object is unrecognized, we have an 80 percent chance of getting the right answer. (Is Munich bigger than Dortmund?)
Three people take the test, which has $\frac{100 \times 99}{2} = 4950$ questions. One (person A) recognizes each and every object in the list. His score is:

$$0.6 \times \frac{100 \times 99}{2} = 2970$$

Person B doesn’t know a thing about the objects in the list. His score is:

$$0.5 \times \frac{100 \times 99}{2} = 2475$$

Person C knows half the list. His score is:

$$0.5 \times \frac{50 \times 49}{2} + 0.6 \times \frac{50 \times 49}{2} + 0.8 \times \frac{50 \times 50}{2} = 612.5 + 735 + 2000 = 3347.5$$

*Moral: A little ignorance can sometimes help.*
